# What is Jorigine ?

J'origine is a **startup** that helps small local producers and artisans to sell their products. Thanks to the J'origine **app**, **tourists** and **local consumers** can easily find producers. J'origine contributes to more responsible consumption.

## Our Goal

Is to make a **web widget** consisting of an interactive **map**. This can be added to any website in order to reference different **local producers**. The main advantage for the users will be to easily **integrate the map to their website**, but also, to be able to decide which producers they would like to display.

## Technologies

**Framework designed to build different applications** for different platforms. The idea is that the **same code** can be used for an app and for a website.

Service offering **database hosting** and **management**, as well as a **real-time communication server**.

The standard **programming language** for the web. Our solution will be developped in JS

## Integration

Expected output : **widget** displaying the map integrated into **any website**.

Concepts covered: data protection, rights management, in-depth analysis of existing websites

## Process

Planning Objectives

Competitors analysis

Tools study + Solution idea

Prototyping solutions

Integrating to tourist offices
