Project description

Aim :

Outdoor long range whitezone geolocation (LoRa, BLE, cellular network)

To be achieved :

Protocol

- conception, implementation & test

Application

- local database, basic data display, data encryption

Not to be achieved :

Server side

How we worked

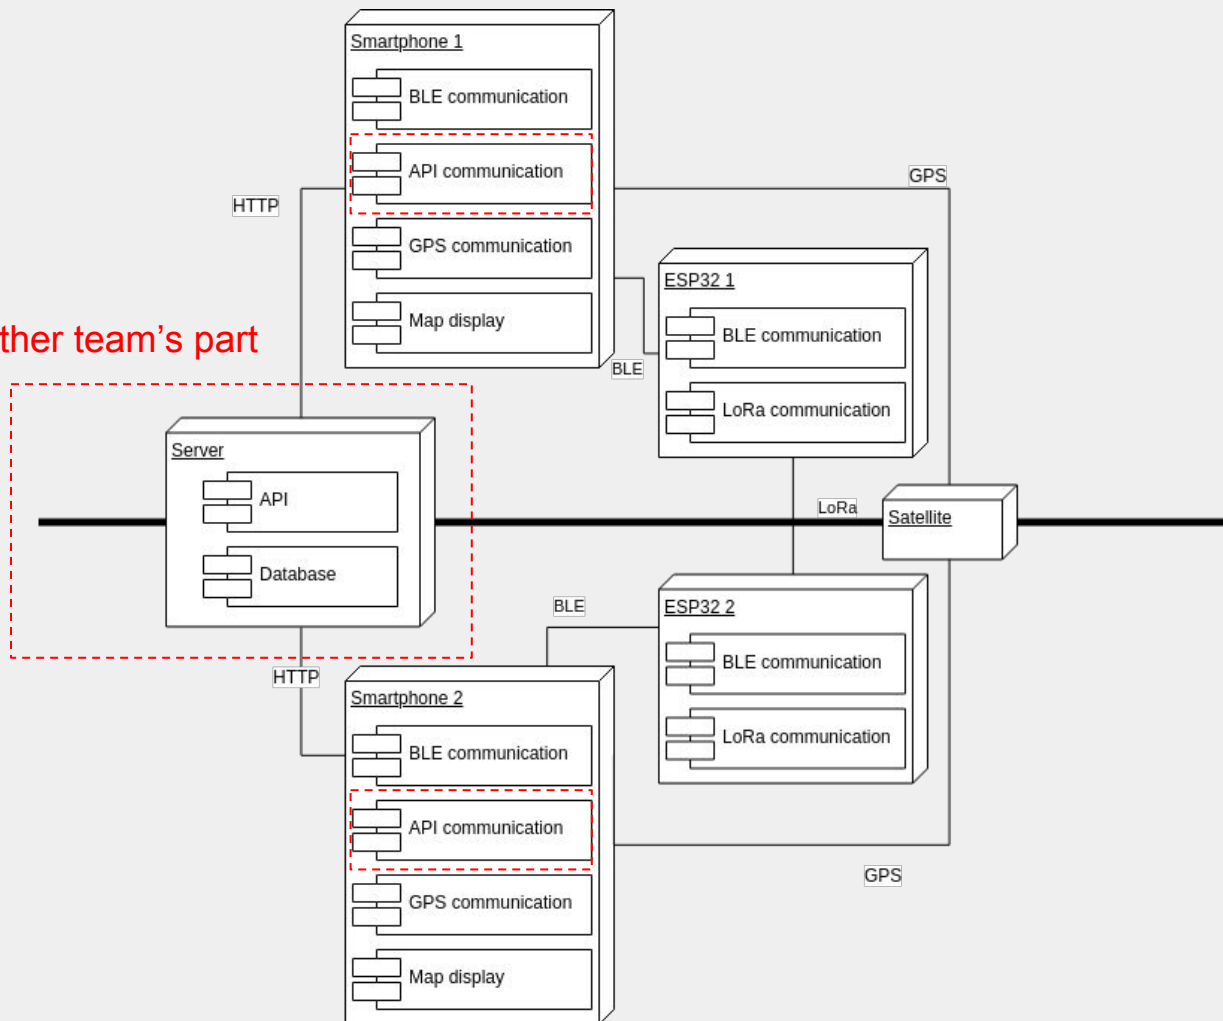

- *Pseudo-scrum*
- *Specification before implementation*
- *Solid baseline*

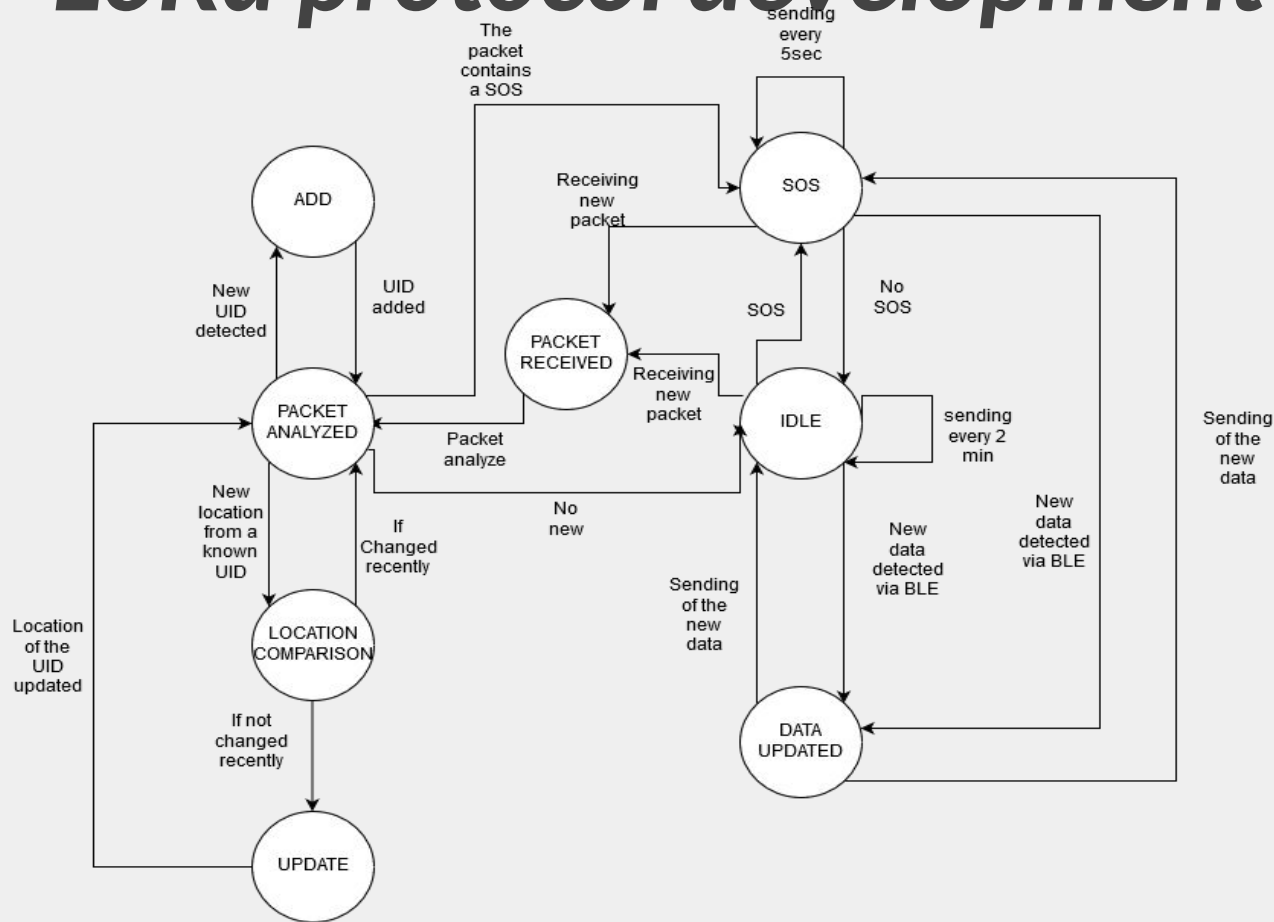

Typedoc

Other team's part

LoRa protocol development

LoRa protocol development

User ID (1byte)	Geolocation (8 bytes)	SOS Flag (1 byte)
--------------------	-----------------------	----------------------

BLE development

Application side

ESP32 side

BLE Connect

SCAN

CREATE COURSE

JOIN COURSE

Scanning for Bluetooth LE Devices

BLE development : App side

- Finished
- Merge on master to do

BLE development : ESP32 side

- Pairing works
- Data exchange to implement

Application development

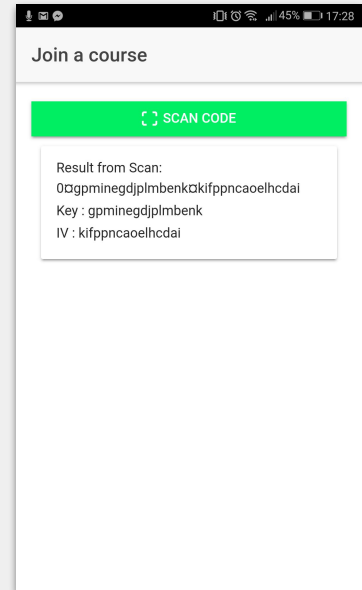

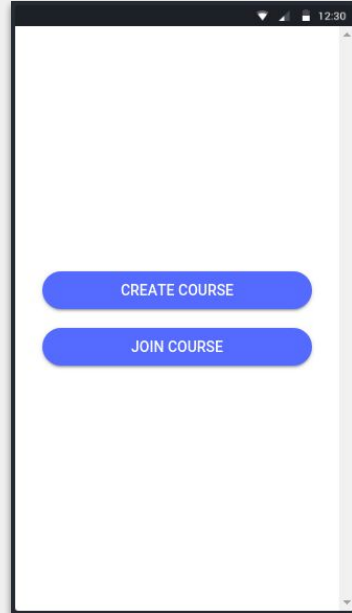

Frontend

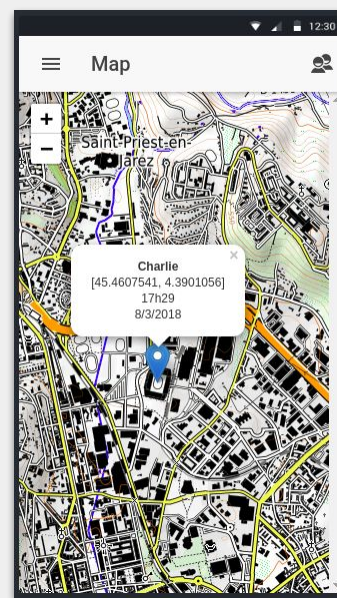

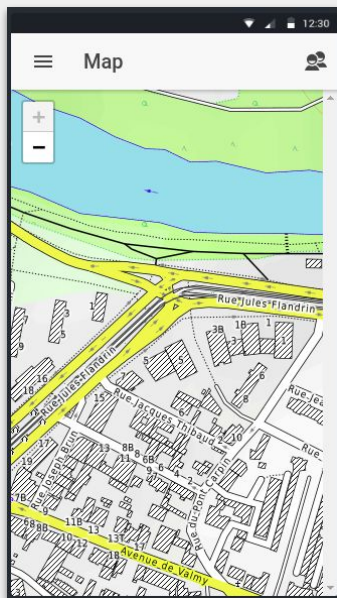

Backend

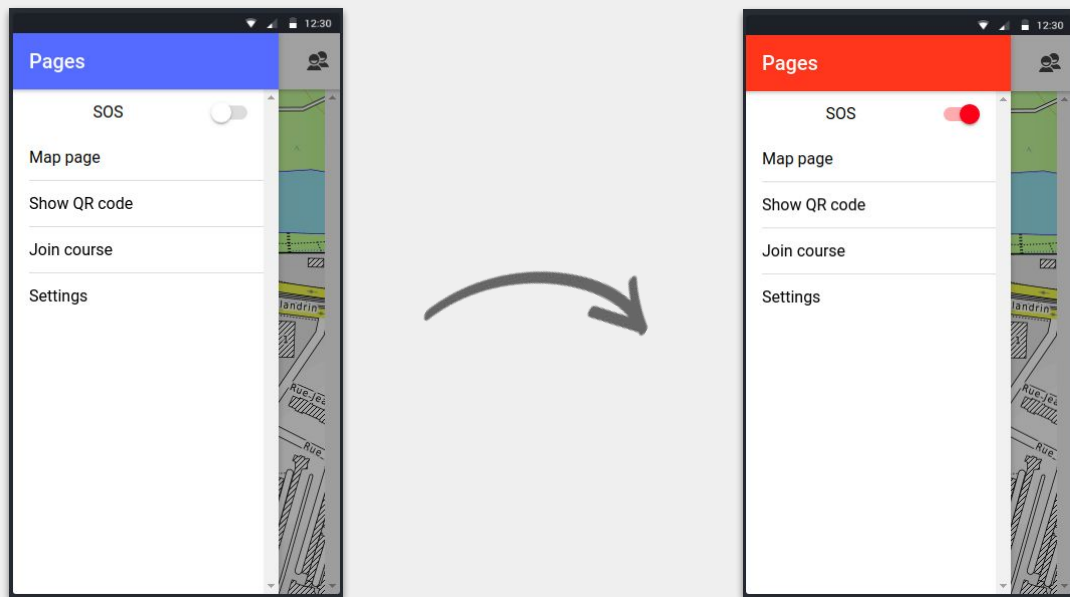

Interface : initialisation phase

Interface

Interface

Issue

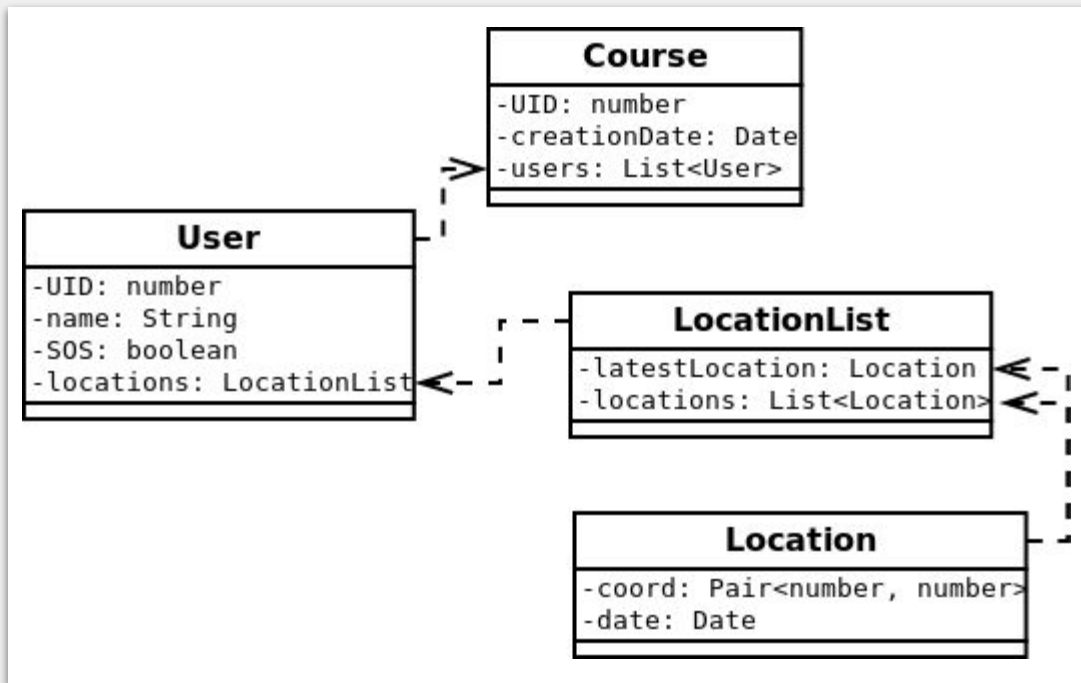

What's the problem ?

New instances on opening pages

What's the solution ?

An injected provider

Backend : data structure

Classes as usual

Injected provider

Backend : Course creation

Creation

On user request
Call to server via API
Shared via QR Code

AES encryption

Key + IV
Shared via QR Code

Remaining work

To complete the project :

BLE communication

Actual calls to the server API

Deporting AES encryption to ESP32

To enhance the project :

Offline map loading

Add protocol version number in packets

Reduction of LoRa packet size

Conclusion

We learned difference between aim and real result

We liked this project

We are proud of what we achieved

We are excited to see next year's version of UltraTeam

***Thanks for your attention !
(Let's see it for real now !)***
