# Context presentation

This project (AstroImage) was realized by three engineer school for the year-end projects and it's registered to the AIR program (Ambient Intelligent Room) of Polytech' Grenoble. He was given with a precise aim and various technical constraints. This kind of project allows student to learn new skills and improve those existing. It's also form in project and team management with schedule & milestones.

## Needs Analyse and Specification

### Aim

AstroImage is a pre-processing software for deep sky pictures. It's allow to treat pictures taken by telescope and pre-process them. This treatment include computing of Master Dark<sup>1</sup>, Master Flat<sup>2</sup> and Master Bias<sup>3</sup>. When this work it's done, the software can now start Registration<sup>4</sup> and Calibration process<sup>5</sup>.

With picture obtain by pre-processing state, we as able to do standard process, like Median Filter, Log Correction, Gamma Correction, or Luminosity correction.

### Requirement specification

Pre-processing of deep sky pictures needs lot of complex calculations. It's necessary for these calculations as fastest as possible. So we must choose the best algorithms.

Furthermore, it's very important for astronomer to not lose any data on the initial pictures. So it's was necessary to implement reliable algorithms.

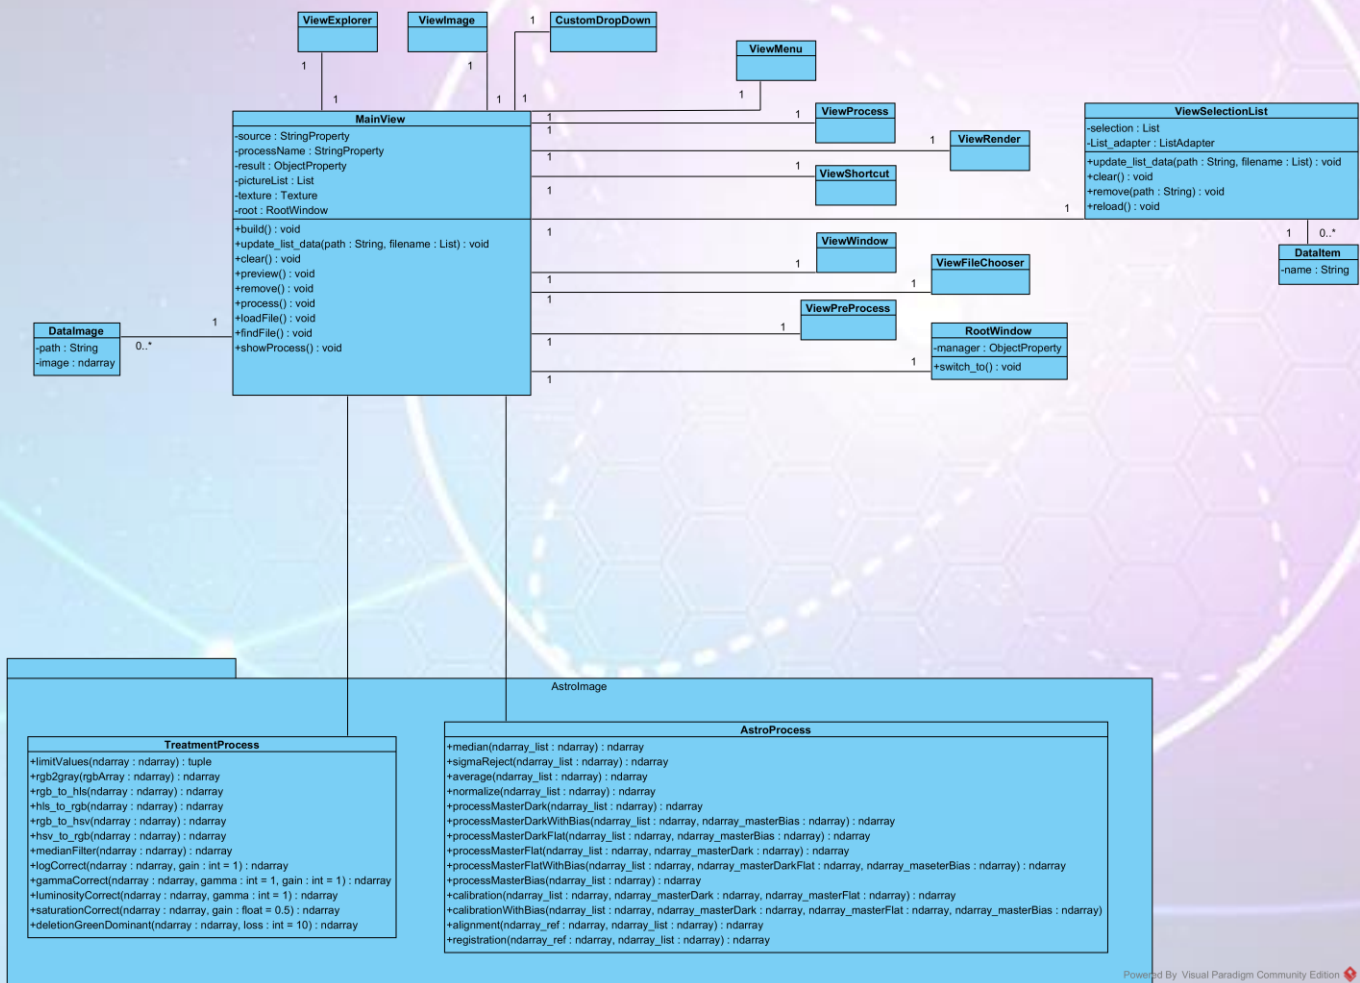

- 
- <sup>1</sup> Process will create a picture used to remove the thermal noise and random noise on our light picture
  - <sup>2</sup> Process will create a picture used to remove all track of dusts, gradient, vignetting on our light picture
  - <sup>3</sup> Process will create a picture used to remove the initial exposure level of pixels in our light
  - <sup>4</sup> Process will shift and combine all light picture
  - <sup>5</sup> Process will use the master Dark & Flat to clean up each light picture

# Constraint

AstroImage contain various technical constraints. First of all the nature of the project require us to use the Python language and kivy for user interface. Secondly, libraries scikit-image and numpy was necessary for all the treatment function.

## Design

### Diagram

## Class description

Like you can see on the previous paragraph, class diagram was inspired by MVC Pattern (Model-View-Controller). Because kivy is very specific with kv language, MainView matching with the controller and the View has not represented in the diagram and correspond to .kv file descriptor. DataImage is the Model and the controller can access of all functions in the 2 libraries :

- **TreatmentProcess** : For basic process like Median Filter or Gamma Correction
- **AstroProcess** : For pre-process of deep sky picture.

## Data representation

For load and process any algorithm on picture, we use the numpy data ndarray.

It's contain various attributes :

<b>T</b>	Same as self.transpose(), except that self is returned if self.ndim < 2.
<b>data</b>	Python buffer object pointing to the start of the array's data.
<b>dtype</b>	Data-type of the array's elements.
<b>flags</b>	Information about the memory layout of the array.
<b>flat</b>	A 1-D iterator over the array.
<b>imag</b>	The imaginary part of the array.
<b>real</b>	The real part of the array.
<b>size</b>	Number of elements in the array.
<b>itemsize</b>	Length of one array element in bytes.
<b>nbytes</b>	Total bytes consumed by the elements of the array.
<b>ndim</b>	Number of array dimensions.
<b>shape</b>	Tuple of array dimensions.
<b>strides</b>	Tuple of bytes to step in each dimension when traversing an array.
<b>ctypes</b>	An object to simplify the interaction of the array with the ctypes module.
<b>base</b>	Base object if memory is from some other object.

# Production

## Technical choice

Because language and used libraries was decided by the project, we had make only little technical choice.

For open RAW picture, we use the rawpy librarie.

For open FITS picture, we use the pyfits librarie

## Graphic interface

### Main view :

**File** : Allow to open a picture

**Edit** : Allow to choose a process and execute on loaded picture

**MasterDark** : Switch to the Master Dark Selection View

**MasterFlat** : Switch to the Master Flat Selection View

**MasterBias** : Switch to the Master Bias Selection View

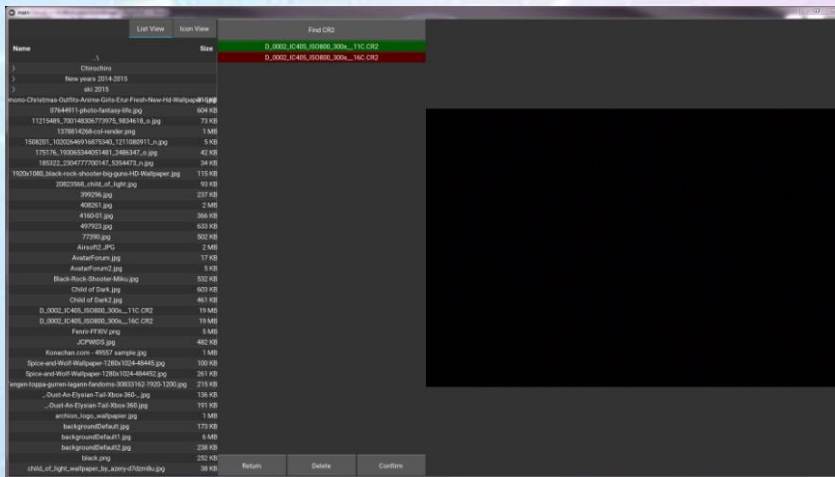

**Registration** : Switch to the Registration Selection View

**File load view :** Simply choose a picture and click to confirm.

**Main View :** Deep sky picture was loaded

**Pre-process View :**

You can find any deep sky picture on the explorer located on the left of the view. In the middle, the loaded deep sky pictures list allow to preview selected file, delete but also find automatically any .CR2 in the current folder
